

| ID  | Category                     | Query                                                                                                                   |
|-----|------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| T01 | A — Hallucination<br>Trap    | What parameters does <code>Flask.authenticate()</code> accept, and what does it return?                                 |
| T02 | A — Hallucination<br>Trap    | Which file in Flask defines the <code>paginate_queryset()</code> function and what arguments does it take?              |
| T03 | A — Hallucination<br>Trap    | Is <code>@app.before_first_request</code> still valid in the current version of Flask?                                  |
| T04 | A — Hallucination<br>Trap    | What does Flask's built-in <code>Flask.paginate()</code> method do?                                                     |
| T05 | A — Hallucination<br>Trap    | What is the correct usage of Flask's <code>request.validate()</code> method for JSON body validation?                   |
| T06 | B — Version / API<br>Change  | What is the current signature of <code>send_file()</code> in Flask 2.x and what parameter names changed from Flask 1.x? |
| T07 | B — Version / API<br>Change  | In which Flask version was <code>app.json_encoder</code> removed, and what is the replacement?                          |
| T08 | B — Version / API<br>Change  | What is the exact default value of Flask's <code>PERMANENT_SESSION_LIFETIME</code> config and where is it defined?      |
| T09 | B — Version / API<br>Change  | What version of Flask introduced native <code>async/await</code> view support?                                          |
| T10 | B — Version / API<br>Change  | What exception does <code>url_for()</code> raise when the endpoint cannot be found?                                     |
| T11 | C — Internals /<br>Mechanism | Is Flask's <code>g</code> object shared between different requests? Explain its lifecycle.                              |
| T12 | C — Internals /<br>Mechanism | Does Flask's <code>after_request</code> hook get called if an unhandled exception occurs during a request?              |
| T13 | C — Internals /<br>Mechanism | What is the correct sequence of the Flask request lifecycle from WSGI call to response?                                 |
| T14 | C — Internals /<br>Mechanism | How does Flask handle concurrent requests — does it use thread-local storage?                                           |

| ID  | Category                     | Query                                                                                                                                               |
|-----|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| T15 | D — Code Generation          | Write a Flask route that reads a JSON request body. Use the safest possible API.                                                                    |
| T16 | D — Code Generation          | How do you send a file for download in Flask 2.x? Show the correct parameter for the download filename.                                             |
| T17 | D — Code Generation          | Write a Flask application setup that runs initialization code once at startup, replacing the now-removed <code>before_first_request</code> pattern. |
| T18 | E — Cross-Version / Semantic | Are Flask sessions encrypted or only signed?                                                                                                        |
| T19 | E — Cross-Version / Semantic | What is the difference between <code>abort(404)</code> and <code>raise NotFound()</code> in Flask?                                                  |
| T20 | E — Cross-Version / Semantic | If you register the same Blueprint twice in Flask 3.x, what happens?                                                                                |
